

Eastway Technical Consultants Ltd.

Professionals in Condition Monitoring

LEAKAGE MANAGEMENT

- We aim to reduce the energy requirements in producing compressed air, by offering a systematic and measurable method of leak detection and repair.
- This can be achieved during normal manufacturing hours for any compressed gas, steam or vacuum.

➤ There are two key ingredients in leakage management:

- 1. Method of Detection and
- 2. Reporting System

- 1. We use ultrasonic leak detection equipment, which filters out production noise and therefore allows us to detect leaks in operating machinery, such as solenoids, regulators and cylinders.
- 2. A comprehensive reporting system is imperative in carrying out a successful repair programme. We have developed a system which identifies the components required to effectively carry out your repairs and also gives details of potential savings.

Above is a basic overview, please contact us for more information.
